

SUPPORT TO **KEY INFRASTRUCTURE** MANAGEMENT

Thanks to its capacity to provide guaranteed and secure communications, GOVSATCOM will be able to support the management of key infrastructures, in particular when they are located in remote areas, when they are the potential target of malicious acts, or when their monitoring is highly depending on automated Machine-to-Machine (M2M) links to retrieve information from on-site sensors. This is the case for energy infrastructures (e.g. power plants), protection infrastructures (e.g. dykes), or transport infrastructures (e.g. bridges) and systems.

GOVSATCOM will also complement the usual means of telecommunications of the EU and Member States' diplomatic networks so that they can rely when needed and anywhere in the world, on trusted satellite communication services completely independent from the hosting states communication infrastructure.

139 EU Missions and Delegations

With 139 EU Missions and Delegations and hundreds of Member States Embassies all over the world, the European diplomatic network may be faced with serious crises at any time and must have access, where appropriate, to secure and independent communications.

GOVSATCOM to support **European Diplomacy**

The European Union Delegations play a vital role in representing the EU and its citizens around the globe, building networks and partnerships. Because they contribute to the promotion of the values and interests of the Union, the 139 Delegations and Offices of the European Union's diplomatic service (European External Action Service - EEAS) are also at the forefront in case of severe diplomatic crisis or armed conflict in the hosting country. In such situations, it is extremely important that the EEAS in Brussels can rely on trusted and secured communications with the concerned EU delegation(s). Supervising protection measures for EU citizens, organising humanitarian support, or representing European interests abroad, EU representatives must be provided with satellite communications solutions independent from the hosting country. Such solutions will be guaranteed by GOVSATCOM.

"The strength of the EU diplomatic network lies in its capacity to efficiently analyse and respond to local critical situations.

This often requires access to a trusted and independent communication solution to exchange sensitive information within the network."

GOVSATCOM to support **the fight against organised crime groups**

"Availability and reliability of secure communication means are essential when it comes to fighting organised crime. It brings essential trustworthiness and operational readiness to the teams."

Organised crime, such as large-scale drug trafficking, impacts citizens' well-being, endangers businesses, and strains government institutions, posing a significant threat to the internal security of the EU and to the safety and livelihood of its people. These organised crime groups are becoming more specialised and more interconnected. They are quick to seize new opportunities and have the resources to exploit potential law enforcement vulnerabilities. To support EUROPOL and Member States Police forces in their critical field operations, GOVSATCOM will provide them with reliable and secure communication means.

In addition to the Management of Key Infrastructures, GOVSATCOM services will also underpin Crisis Management as well as Border and Maritime Surveillance.
